

ELECTRIC UTILITY PERFORMANCE

RANKING MICHIGAN AMONGST THE STATES • 2019 EDITION

The Citizens Utility Board of Michigan (CUB of MI) was formed in 2018 to represent the interests of residential energy customers across the state of Michigan. CUB of MI educates and engages Michigan consumers in support of cost-effective investment in energy efficiency and renewable energy and against unfair rate increase requests. CUB of MI gives a voice to Michigan utility customers and helps to ensure that citizens of the state pay the lowest reasonable rate for utility services and also benefit from the environmental implications of investment in clean energy. CUB of MI is a nonpartisan, nonprofit organization whose members are individual residential customers of Michigan's energy utilities. For more information, visit www.cubofmichigan.org.

This report was prepared for Citizens Utility Board of Michigan by 5 Lakes Energy. 5 Lakes Energy is a Michigan-based policy consulting firm dedicated to advancing policies and programs that promote clean energy and sound water policy for a resilient environment. For more information, visit <https://5lakesenergy.com/>.

Executive Summary

Michigan's electric utilities perform well below average compared to utilities in the rest of the country on three important metrics, according to an analysis completed for the Citizens Utility Board of Michigan.

Focusing on reliability, affordability and environmental impacts, this study finds that Michigan continues to fall behind other states on these key energy issues. These findings may be particularly important for policymakers and stakeholders that hope to improve Michigan's economic competitiveness.

Reliability: In an age of information technology when any interruption in service can paralyze economic activity, reliable power is critical.

In terms of the average time to restore power to a customer after an outage, Michigan ranked 4th worst in the nation in 2017, the most recent year in which full data is available, according to data gathered by the U.S. Department of Energy's Energy Information Administration (EIA). When extreme weather days are excluded, Michigan falls to 2nd worst in the nation.

In other words, even after accounting for the fact that Michigan is far less exposed to natural disasters than many other states (for example, Hurricane Sandy, which caused mass disruptions for New York and New Jersey utilities), Michigan utility customers spend more time waiting for the power to come back on than customers in all but a handful of other states. In addition, annual data over the past several years shows that this poor performance has been consistent.

Looking only at the number of outages per customer (not taking into account how long those outages last) and still excluding major event days, Michigan is actually slightly above average. However, even with fewer outages, Michigan customers still spend more time in the dark than customers in most states, suggesting that Michigan utilities are particularly bad at restoring power once there is an outage.

It is important to note that electricity outages typically occur at the distribution system—the local electric wires that connect neighborhoods to substations—as opposed to the generation system (i.e., power plants, nuclear reactors or renewable sources like wind turbines or solar panels) or the transmission level (high-voltage electricity lines that carry power from the power plants and other sources to the distribution system). Generation and transmission only account for about 1% of outages, both nationally and in Michigan. So, while power plants and transmission lines are often owned and/or planned by non-utility entities, the distribution system in Michigan and most other states is almost entirely the utility's responsibility.

Affordability: Energy costs can pose a heavy burden for businesses and residents, harming the state's economic competitiveness and worsening poverty. Michiganders pay the 16th-highest residential bills for energy out of the 50 states and DC, and the highest in the Midwest. As a percentage of median household income, Michigan is 17th-highest. That finding is based on how much the typical household pays for a kilowatt-hour of electricity, as well as non-electricity energy expenditures such as natural gas or propane for home heating.

Michigan's electricity is particularly expensive for residential customers. For a typical residential household, Michigan's average cost per kWh of 15.4 cents is 12th-highest in the country. Commercial

customers are not spared, however – they pay 11.0 cents/kWh, or 14th-highest. The one group that does enjoy relatively low rates is industrial customers, who pay 7.19 cents/kWh, 24th-highest.

Environmental impacts: The production of energy can create excessive pollution that harms residents' health, livelihoods and ability to enjoy the state's natural beauty.

EIA data show that Michigan power plants emit higher than average amounts of carbon dioxide, which contributes to climate change, sulfur dioxide, which leads to asthma attacks and cardiopulmonary disease, and nitrous oxide, which creates breathing problems and air filled with particulate matter. In 2017, Michigan had the 20th-worst CO₂ emissions for each kWh of electricity generated in the state, the 10th-worst sulfur dioxide emissions per kWh and the 21st-worst nitrous oxide emissions per kWh.

One reason for Michigan's relatively dirty energy supply is that it ranks 19th-lowest in the country in terms of percentage of power generated by renewable resources, like wind and solar.

Introduction and Background

Reliability, affordability and management of environmental impacts are commonly considered to be the primary performance criteria for electric utilities. This paper provides a scorecard measuring the aggregate performance of Michigan’s electric utilities on these criteria in comparison to the aggregate performance of the other 49 states and the District of Columbia. While aspects of electric utility performance are affected by location, climate and the composition of the state’s economy, these rankings also reflect the historical effectiveness of the state’s utility regulatory policy.

The following tables show Michigan’s rank for each metric. For each metric reported, states are ranked in order from worst performance to best; a high rank (low number) implies worse performance than a low rank. The Energy Information Administration (EIA) of the US Department of Energy has released reliability, price, emissions, and generation data for 2017. All time-series tables show states or utilities ranked based on their performance in the most recent reported year and color gradients are occasionally used to display year-to-year improvements or declines. In the stacked bar charts below, the first colored segment shows SAIDI, SAIFI, and CAIDI without Major Event Days, while the second colored segment shows the *additional* portion of SAIDI, SAIFI, and CAIDI attributable to Major Event Days, so that the sum of these two segments (and combined length of the two segments) equals SAIDI, SAIFI, or CAIDI with Major Event Days.¹ These charts are sorted largest-smallest for each respective metric with Major Event Days.

Overall Rankings

Reliability

Metric	Michigan Rank 2017 (Worst-Best)
Annual minutes of outage per customer (SAIDI) with Major Event Days (MED)	6
Annual minutes of outage per customer (SAIDI) without Major Event Days (MED)	8
Annual outages per customer (SAIFI) with MED	22
Annual outages per customer (SAIFI) without MED	28
Average restoration time per outage (CAIDI) with MED	4
Average restoration time per outage (CAIDI) without MED	2

¹ Any metric including Major Event Days is at least as large as the same metric reported without Major Event Days. The two metrics could be equal for a given state or utility that attributes no outage occurrences to Major Events.

Affordability

Metric	Michigan Rank 2017 (Worst-Best)
Residential Average Monthly Bill	41
Electricity and Non-Electricity Energy Expenditures per Household	16
Non-Electricity Energy Expenditures per Household	11
Electricity Expenditures per Household	41
Energy Expenditures as a % of Median Household Income	17
	Michigan Rank 2017 (Worst-Best)
Price - All Sectors	14
Price - Residential	12
Price - Commercial	14
Price - Industrial	24

Environmental Impacts

Metric	Michigan Rank 2017 (Worst-Best)
Metric Tons CO2 Emissions per million kWh Generated	20
Metric Tons SO2 Emissions per million kWh Generated	10
Metric Tons NOX Emissions per million kWh Generated	21
Total CO2 Emissions from Electricity Generation	11
Total SO2 Emissions from Electricity Generation	6
Total NOX Emissions from Electricity Generation	10
Total Renewable Generation	32
Total Renewable Generation without Hydroelectric	39
Renewable Generation as % of Total Generation	19

Renewable Generation as % of Total Generation without Hydroelectric	27
Renewable Generation as % of Total Sales	21
Renewable Generation as % of Total Sales without Hydroelectric	28

Reliability

Electricity is one of the essentials of modern life, so reliability of electricity supply is an important attribute of utility performance. Much of the public discussion about electric utility reliability focuses on what utility regulators and utilities call Resource Adequacy. Resource Adequacy ensures that there is sufficient power generation capacity to satisfy utility customer peak demand. However, loss of electricity supply due to generation or transmission problems accounts for only about 1% of outage minutes nationally and in Michigan. Instead, breakdowns in the electricity distribution system cause the vast majority of power outages that utility customers experience on a regular basis. These may occur because storms break power lines, animals touch pairs of power lines and cause a “short,” because equipment fails or many other proximate causes.

The electric power industry, led by the Institute of Electrical and Electronics Engineers (IEEE) has determined that the best overall measure of an electric utility’s reliability is the average number of minutes of outage per year per customer, calculated by a method referred to as the System Average Interruption Duration Index (SAIDI). Important elements of SAIDI are the average number of outages per customer per year and the average duration of each customer outage. Outages per customer per year are computed by a method referred to as the System Average Interruption Frequency Index (SAIFI) while the average duration of each customer outage is computed by a method referred to as Customer Average Interruption Duration Index (CAIDI). CAIDI measures the average time for the utility to restore power to a customer after an outage starts.

Beginning in 2013, the EIA began collecting annual reports of SAIDI, SAIFI, and CAIDI from utilities and publishing those data in annual compilations, which may be downloaded from <http://www.eia.gov/electricity/data/eia861/>. The latest available reliability data from EIA are for calendar year 2017. The EIA collects SAIDI and SAIFI metrics with and without Major Event Days (MED). Major Event Days are a statistical classification, defined by the IEEE, of large outage events such as ice storms, wind storms, and hurricanes, that can materially affect annual reliability statistics. While reliability metrics that include Major Event Days can fluctuate greatly year-to-year, they provide a more accurate representation of customer experience than metrics excluding Major Event Days. For this reason, reliability data are presented with and without Major Event Days.

We computed SAIDI, SAIFI and CAIDI with and without Major Event Days by state using an average of the reporting utilities within each state, weighted by the number of customers served by each utility.²

The following table shows Michigan’s 2017 performance on each of these standard reliability metrics, with and without Major Event Days. In addition, Michigan’s rank from worst to best (1=worst, 51= best) amongst the states, including the District of Columbia, is shown in parenthesis for each metric.

² SAIFI values over 500 were considered data entry errors. Four SAIFI with MED and three SAIFI without MED observations from 2013 were greater than 500 and were subsequently removed from the dataset prior to calculating weighted SAIFI with MED and weighted SAIFI without MED: BARC Electric Coop (VA), Gibson Electric Members Coop (TN and FL), and Pioneer Electric Coop (AL).

2017 Metric	With Major Event Days	Without Major Event Days
Annual minutes outage per customer (SAIDI)	779 minutes (6 th worst)	179 minutes (8 th worst)
Annual outages per customer (SAIFI)	1.41 outages (22 nd worst)	0.99 outages (28 th worst)
Average restoration time per outage (CAIDI)	551 minutes (4 th worst)	181 minutes (2 nd worst)

Michigan’s overall poor performance in annual minutes of outage per customer (SAIDI) reflects average performance on the frequency of outages (SAIFI) and very poor performance on restoration following an outage (CAIDI), whether the outage is on a Major Event Day or not.

More detailed analysis of the reliability of Michigan’s electric utilities compared to that of other states follows.

Average Minutes of Outage per Customer per Year (SAIDI)

As can be seen in the following Figure 2 and Figure 3, in 2017 Michigan ranked 6th worst amongst the states in overall average number of minutes of outage per customer (SAIDI with Major Event Days) over the year and 8th worst in number of minutes of outage per customer (SAIDI without Major Event Days) over the year. The states that ranked worse than Michigan in minutes of outage including Major Event Days but better than Michigan in minutes of outage excluding Major Event Days were mostly those that experienced hurricane-related damage or Nor’easter-related damage in 2017. Michigan also experienced a major wind storm in 2017.

Annual data from 2013-2017 in Figure 2 and Figure 3 shows that Michigan’s poor performance in SAIDI without Major Event Days has been consistent, while SAIDI with Major Event Days steadily improved from 2013 to 2016 but relapsed to 2013 levels in 2017. In these tables, the trend graphs in the right-most column use a uniform scale so that rows representing states can be visually compared. Names of Michigan’s neighboring states are shown in bold to facilitate comparison within the region.

Outages per customer per year (SAIFI)

Minutes of outage per customer per year (SAIDI) can be understood as the product of the number of outages per customer per year (SAIFI) and the average time to restore power after an outage (CAIDI).

Figure 5 and Figure 6 show Michigan's number of outages per customer per year compared to other states, with and without Major Event Days. In 2017, Michigan performed near the median in outages per customer (SAIFI with Major Event Days), ranking 22nd worst (30th best) amongst all states. When Major Event Days are excluded, Michigan's rank improves to 24th best (28th worst) overall.

Annual data from 2013-2017 in Figure 5 and Figure 6 show that Michigan's SAIFI with Major Event Days for 2016 is a significant improvement over 2014 and 2015 but worsened from 2016 to 2017. When Major Event Days are excluded, Michigan's performance has been fairly consistent for the last three years, although worse, on average, than 2013-2014.

Figure 4: System Average Interruption Frequency Index including and excluding Major Event Days for each State in 2017.

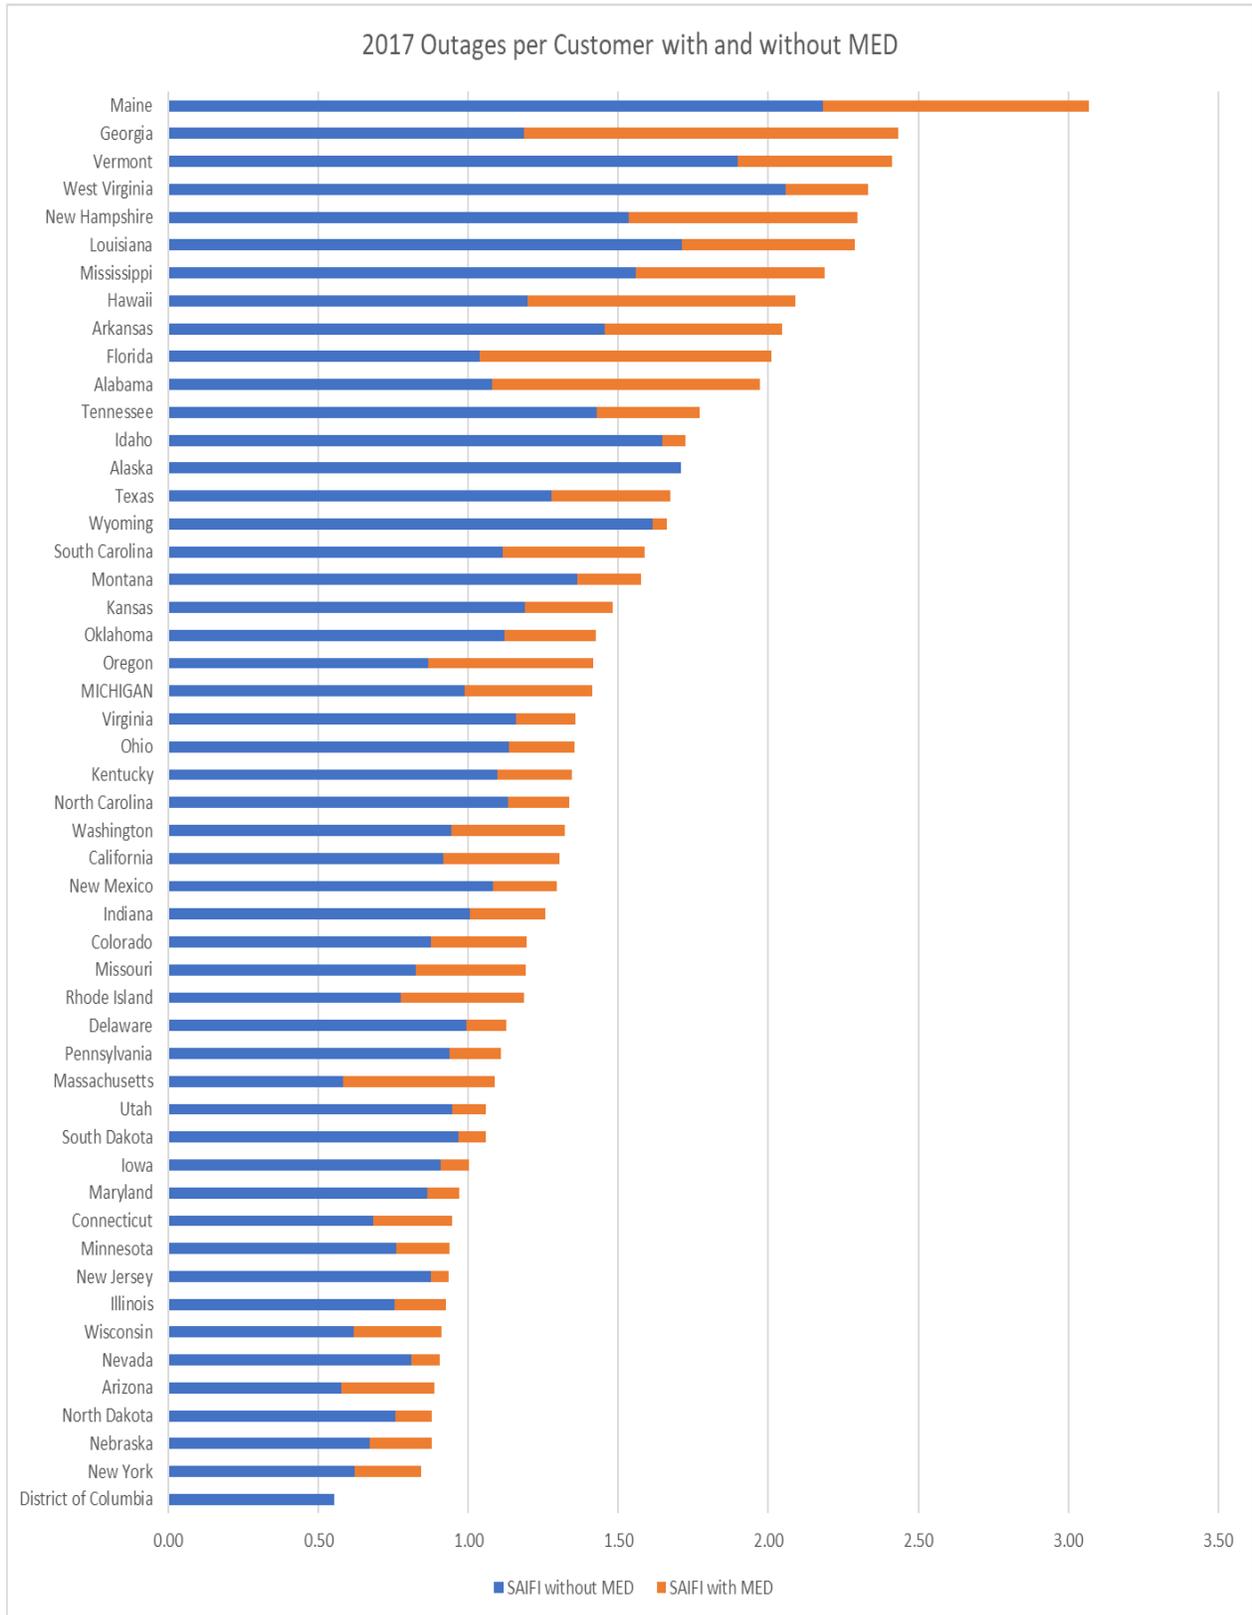

Figure 5: Annual System Average Interruption Frequency Index including Major Event Days in each State 2013-2017.

Average minutes to restore power to a customer (CAIDI)

Michigan's poor performance on annual outage minutes per customer (SAIDI) and middling or better performance on the number of outages per customer per year (SAIFI) reflects that Michigan's power restoration following an outage (CAIDI) is quite poor. Figure 8 shows that, including Major Event Days, Michigan ranked 4th worst amongst the states in average power restoration time following a customer outage (CAIDI). Figure 9 shows that excluding Major Event Days, Michigan's performance is even worse, ranking 2nd worst amongst all states in average power restoration time following an outage.

Annual data from 2013-2017 in Figure 8 and Figure 9 show modest annual improvements, if any. Michigan utilities performed poorly on CAIDI in 2013, both with and without Major Event Days, and slightly improved CAIDI, but not relative rank, each year until 2016. But, CAIDI with Major Event Days spiked in 2017.

Figure 7: Customer Average Interruption Duration Index including and excluding Major Event Days for each State in 2017.

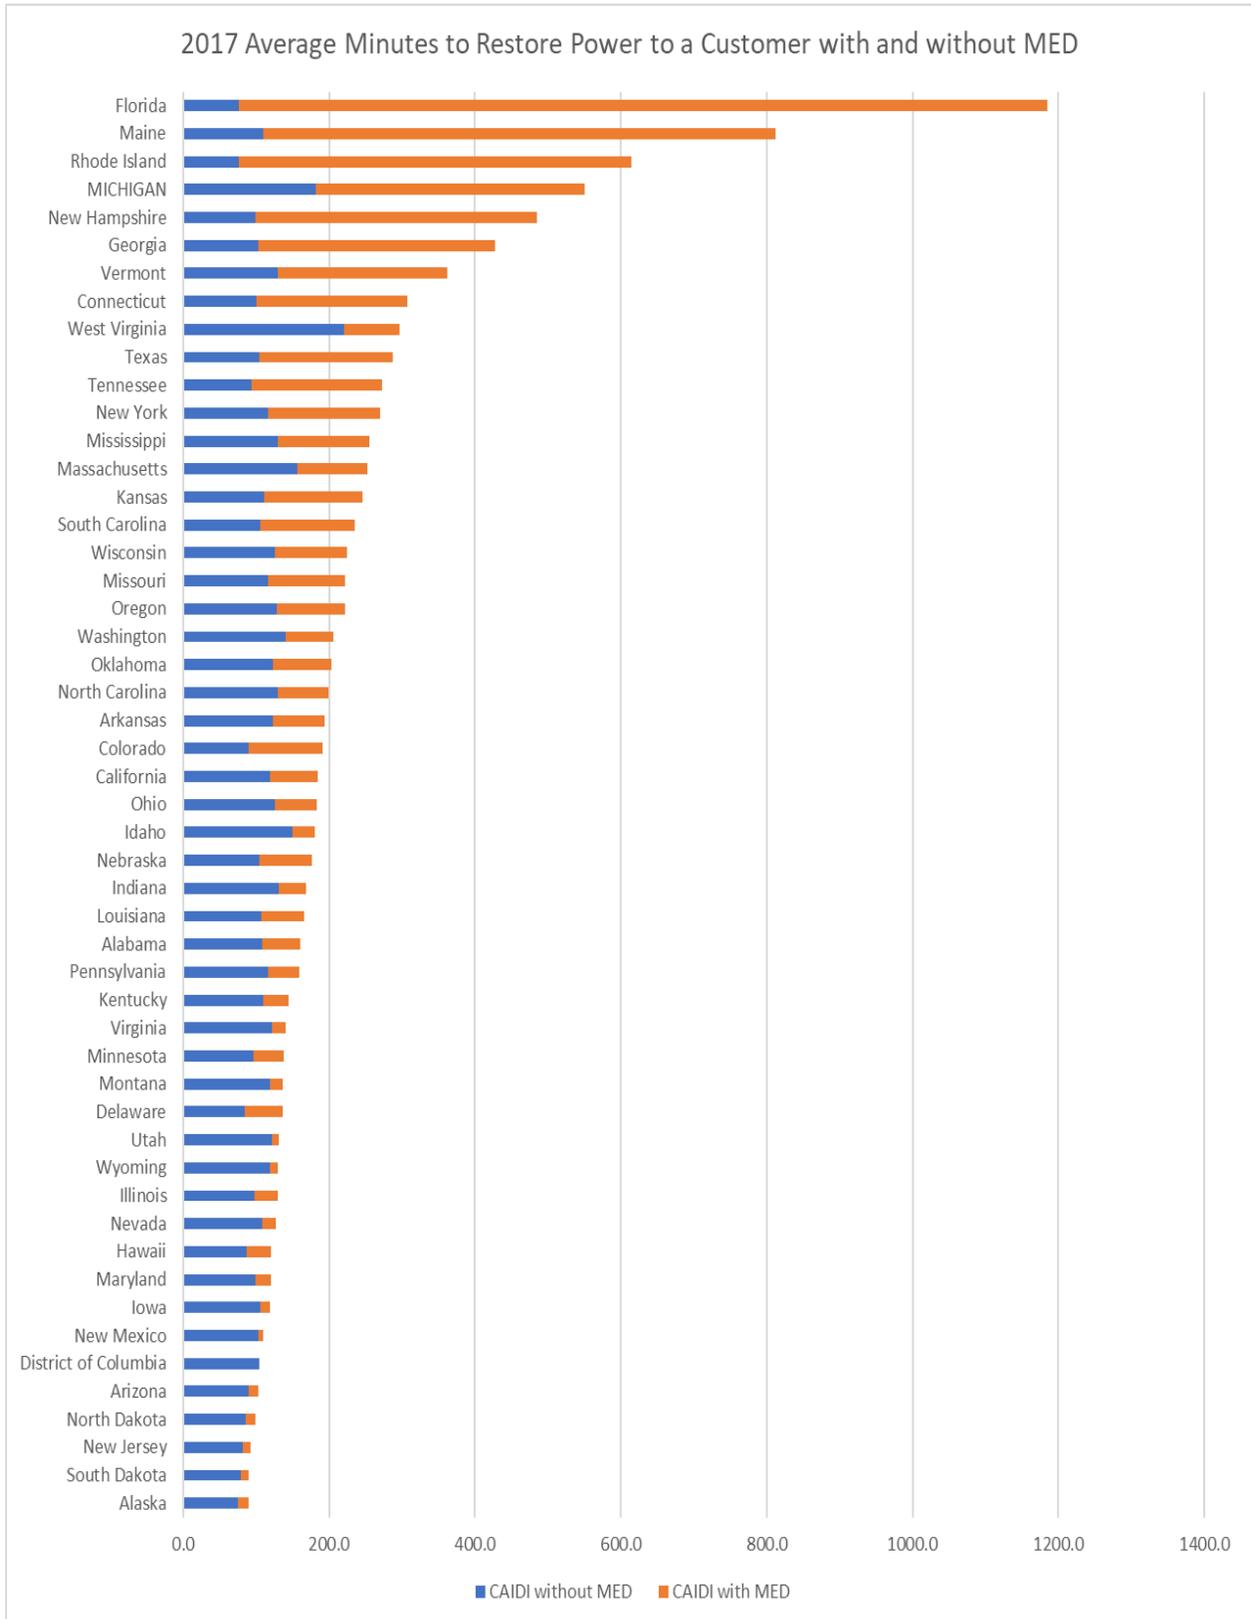

Figure 8: Annual Customer Average Interruption Duration Index including Major Event Days in each State 2013-2017.

Affordability

Residential Energy Affordability

The cost of electricity can be critically important to residential households who must balance their spending on electricity against spending on other essentials of modern life. Electricity costs can also have a huge impact on the operating margins of competitive industries.

The affordability of electricity is a nuanced matter. For households, climate and the availability of alternative heating fuels can affect the amount of electricity they consume. Expenditures on electricity and other heating fuels must be considered in context of income, so it is important to compare total household energy expenses to total household energy expenses as a share of household income.

Commercial and industrial users of electricity are less affected by climate and heating fuels, so the technologies of commerce and production can be more consistent from place to place. However, different types of businesses have very different energy requirements and often are clustered in different states for reasons having little to do with energy costs. Thus, total commercial and industrial energy cost is not a good basis for comparison; rates comparison is more useful and is addressed later in this report.

Below, we first examine household energy expenditures, then look at electricity rates for residential, commercial and industrial customers.

The prices of electricity and heating fuels are far from the only determining factor for overall energy affordability. For example, whereas households in warmer climates may consume more electricity than households in colder climates on an annual basis to run air conditioning units, those same households will not spend as much on natural gas, propane or other heating fuels during the winter. Energy expenditures are measured by the EIA in the State Energy Data System (SEDS) database at <https://www.eia.gov/state/seds/>. The following graph shows residential electricity and non-electricity energy expenditures per household by state.

As shown in Figure 10, Michigan had the 41st highest electricity expenditure per household, the 11th highest non-electricity, non-transportation expenditures per household, and the 16th highest total non-transportation energy expenditures per household in 2017. These rankings reflect that Michigan has relatively greater need for heating than many states and makes extensive use of natural gas and other heating fuels, rather than electricity, for heating. Electricity expenditures were \$1,169 per household per year and non-electricity non-transportation energy expenditures were \$774 per household per year for a total of \$1,943 per household per year.

Figure 11 shows that total household non-transportation energy expenditures as a percent of median household income in Michigan ranked 17th highest in the country, at 3.4%.

2017 Metric	Value	Michigan's Rank
Household Electricity Expenditure	\$1,169 per year	41 st highest
Household Non-electric Energy Expenditure	\$774 per year	11 th highest
Household Total Energy Expenditure	\$1,943 per year	16 th highest
Household Energy Share of Median Household Income	3.4%	17 th highest

Figure 10: Average non-transportation energy expenditures per household in each State in 2017.

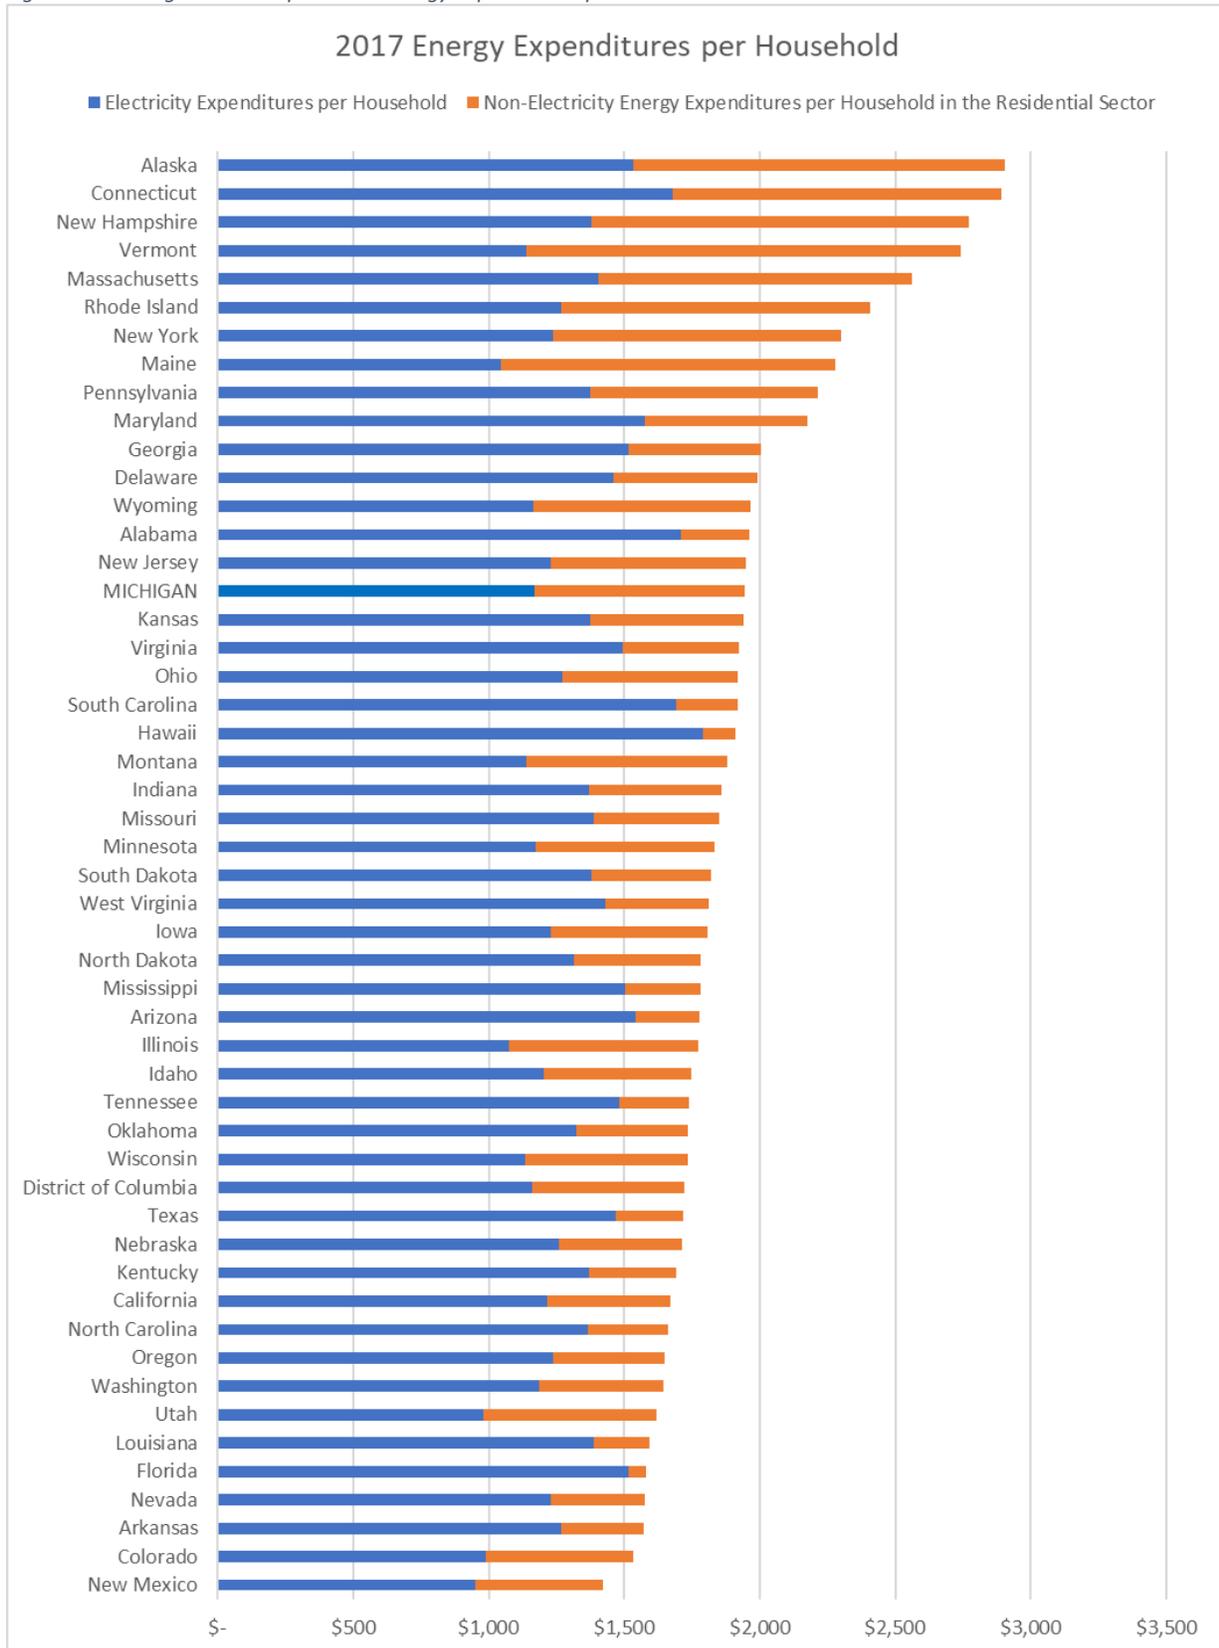

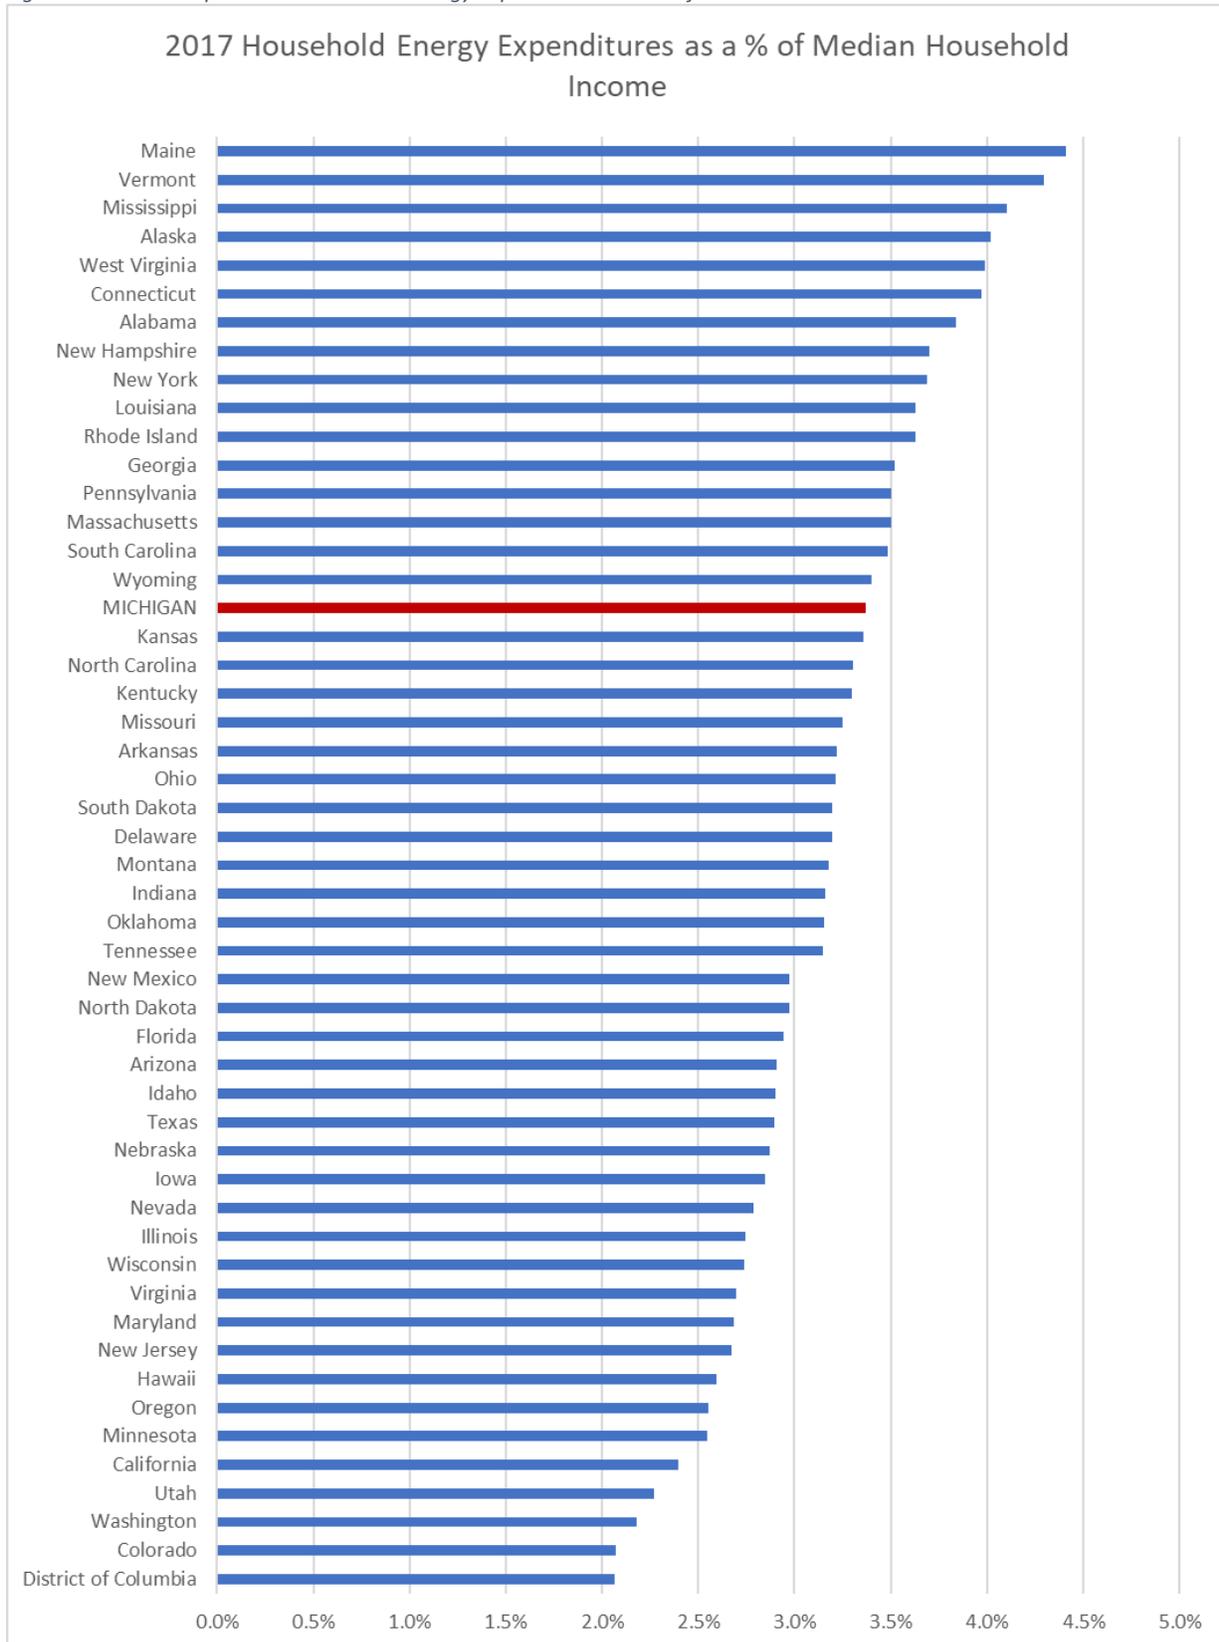

Figure 11: Non-transportation household energy expenditures as a % of median household income in each State in 2017.

Residential Average Monthly Bill

Figure 12 shows that in 2017, Michigan residential customers paid the 11th lowest average monthly electricity bill. However, electricity expenditures are only one component of household energy expenditures and thus when analyzed in isolation to other household energy expenditures, do not accurately reflect overall energy affordability.

Annual data in Figure 13 show that Michigan's average residential household's electricity bill has grown by 3.36% annually from 2007-2017, the 6th fastest growth rate overall. During that time, Michigan was outpaced by only West Virginia, Kansas, Idaho, South Dakota and Wyoming.

Figure 12: Average Monthly Electricity Bill for a Residential Household in 2017.

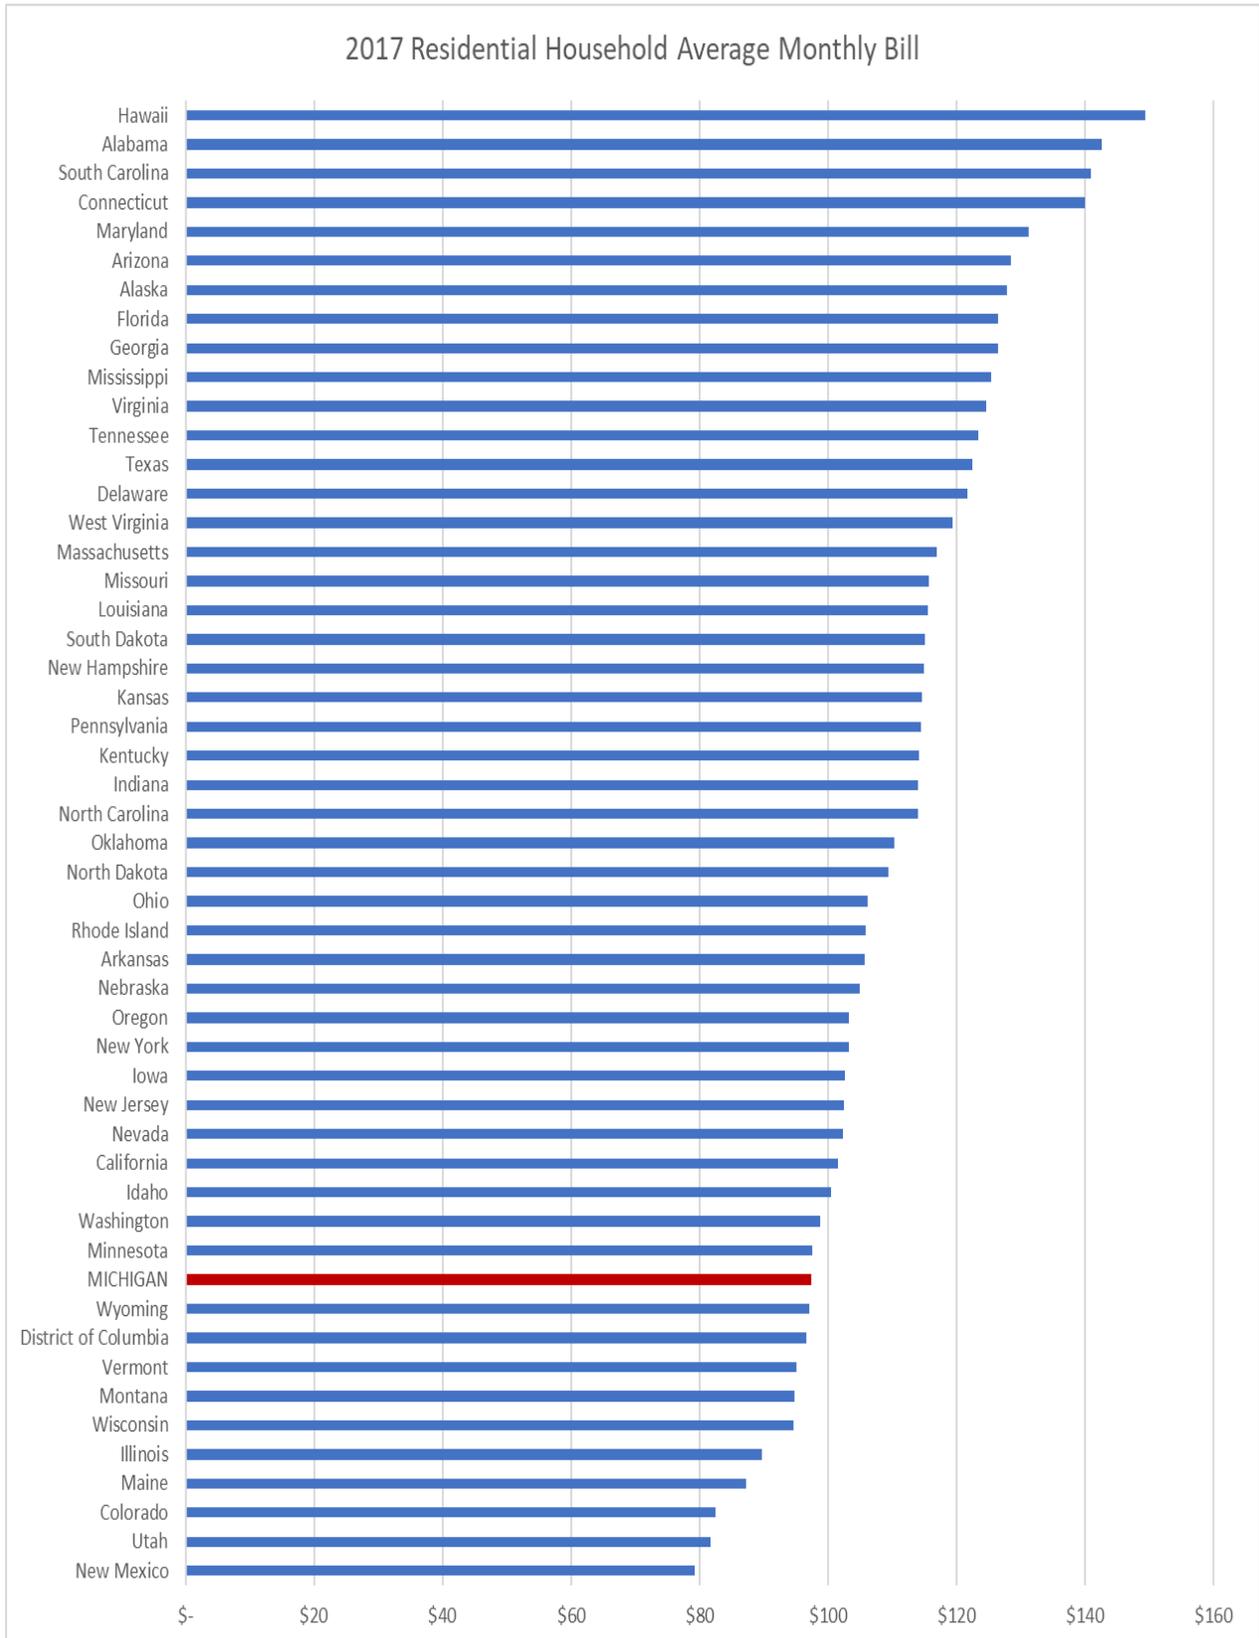

Figure 13: Annual average electricity bill for residential households in each state 2007-2017.

Electricity Rates

Electricity bills often have many components – fixed monthly charges, charges based on the customer’s peak rate of power usage in the billing month or previous year and a charge per kWh of electricity are common billing determinants. The ways in which utilities assign costs to these various components of the bill vary greatly amongst utilities, amongst classes of customers and across states. Customers, however, are getting value from kWh of electric energy so dividing the total bill by the kWh used is generally the best way to compare utility costs.

The Energy Information Administration of the US Department of Energy collects monthly data from each utility in each state on the amounts of electricity sold and revenue from electricity by customer class. Customer classes include residential, commercial, industrial, transportation and other with almost all electricity delivered in most states going to the first three classes. EIA makes these data available through an Electric Data Browser on its web site, at <http://www.eia.gov/electricity/data/browser/>. Calendar year 2017 is the most recent complete year available and is used here for comparison of the cost of electricity in the various states, reported in cents per kWh.

Michigan’s electricity rates are summarized in the following table.

2017 Metric	Value	Michigan’s Rank
Residential electricity cost per kWh	15.40 cents	12 th highest
Commercial electricity cost per kWh	11.00 cents	14 th highest
Industrial electricity cost per kWh	7.19 cents	24 th highest
All sectors electricity cost per kWh	11.28 cents	14 th highest

Residential Sector Electricity Rates

Although affordability is the most important measure of household energy costs, residential electricity rates are also worth comparing across states.

As shown in Figure 14, Michigan’s 15.40 cents per kilowatt-hour price of electricity for the residential sector is high relative to other states, with Michigan ranking 12th highest. Figure 15 shows that Michigan’s electricity price for residential customers has increased nearly every year for the past ten years with an average compound annual growth rate of 4.20%. Only Kansas, West Virginia, Missouri and Idaho have experienced faster growth in residential electricity rates over this period.

Figure 14: Average cost per kilowatt-hour of electricity delivered to residential customers in each State in 2017.

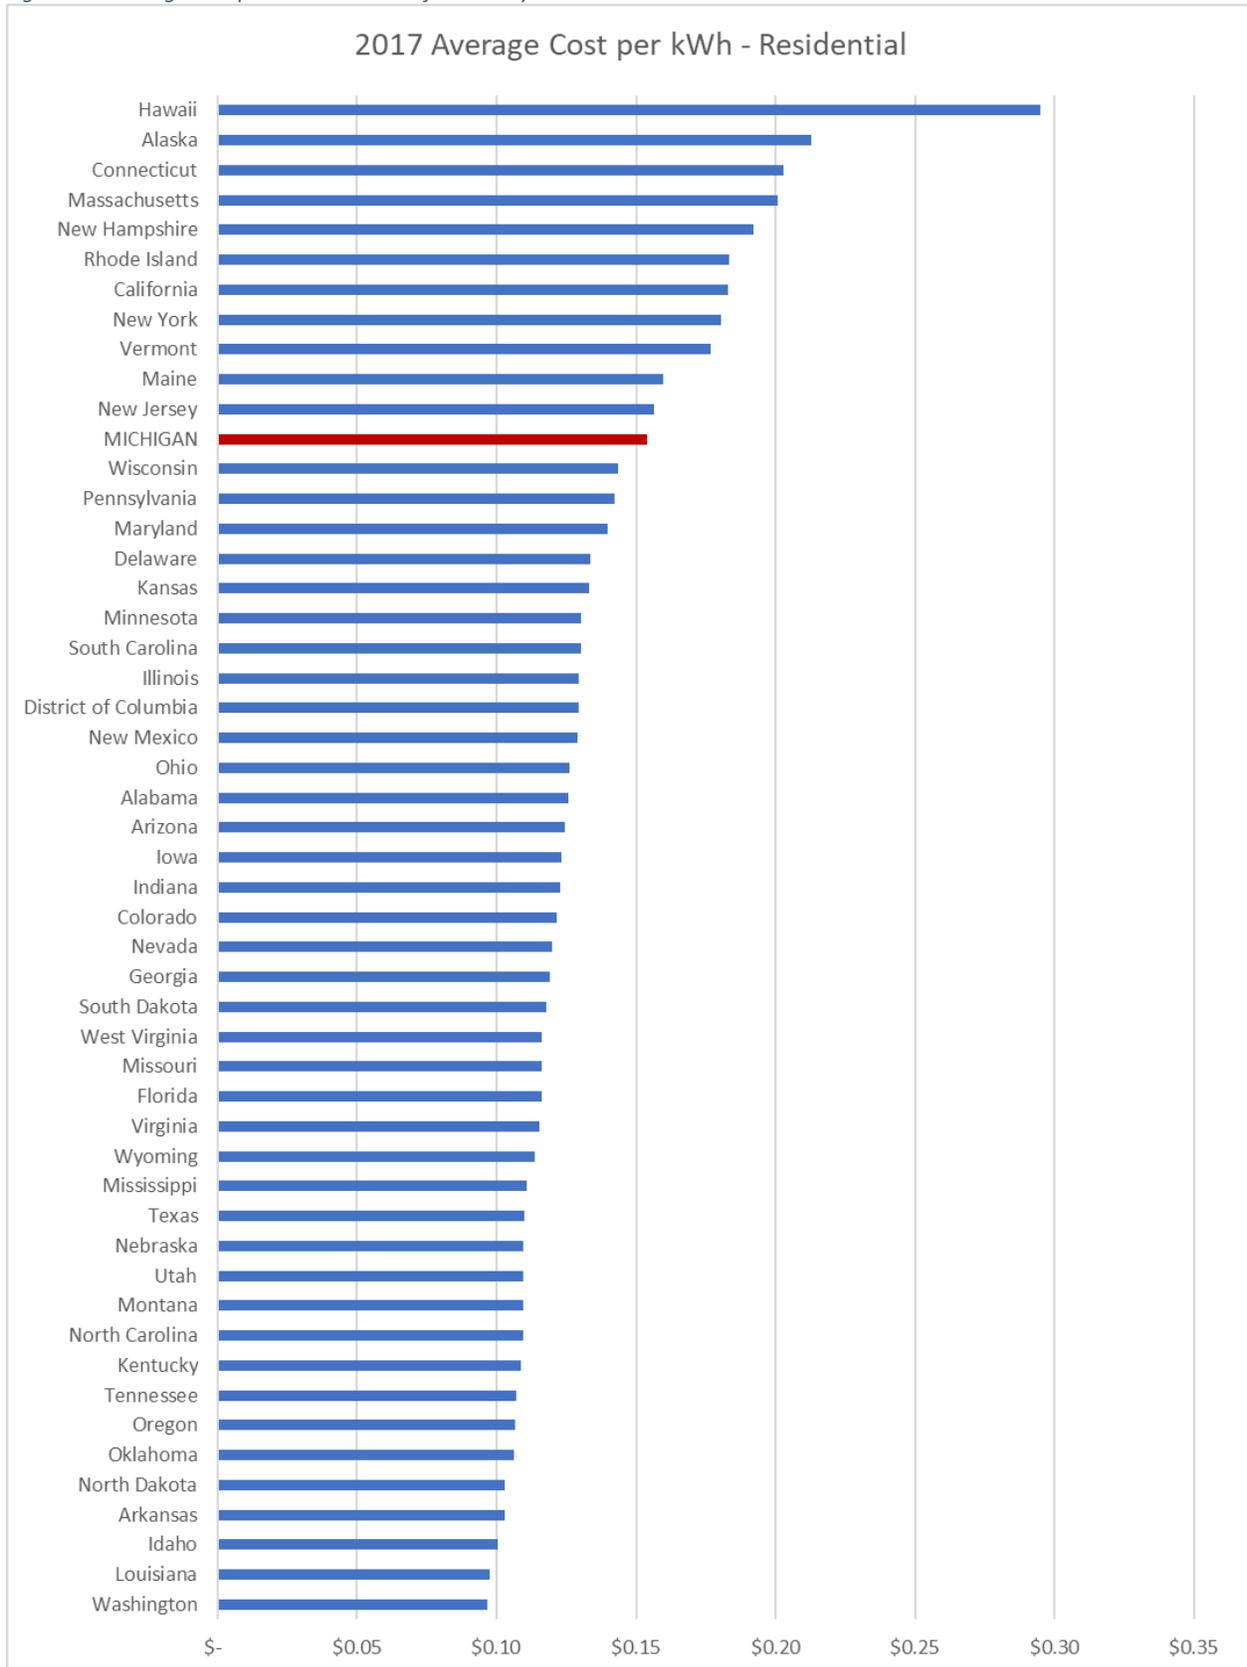

Figure 15: Annual average cost per kilowatt-hour delivered to residential customers in each State 2007-2017.

Commercial Sector Electricity Rates

As shown in Figure 16, Michigan's 11.00 cents per kilowatt-hour price of electricity for the commercial sector is high relative to other states, with Michigan ranking 14th highest. Figure 17 shows that Michigan's electricity price for commercial customers has increased every year until 2013 and then declined modestly before climbing again in 2017. The average compound annual growth rate of Michigan's commercial electricity cost from 2007-2017 was 2.29%, which was approximately the median of the states.

Figure 16: Average cost per kilowatt-hour of electricity delivered to commercial customers in each State in 2017.

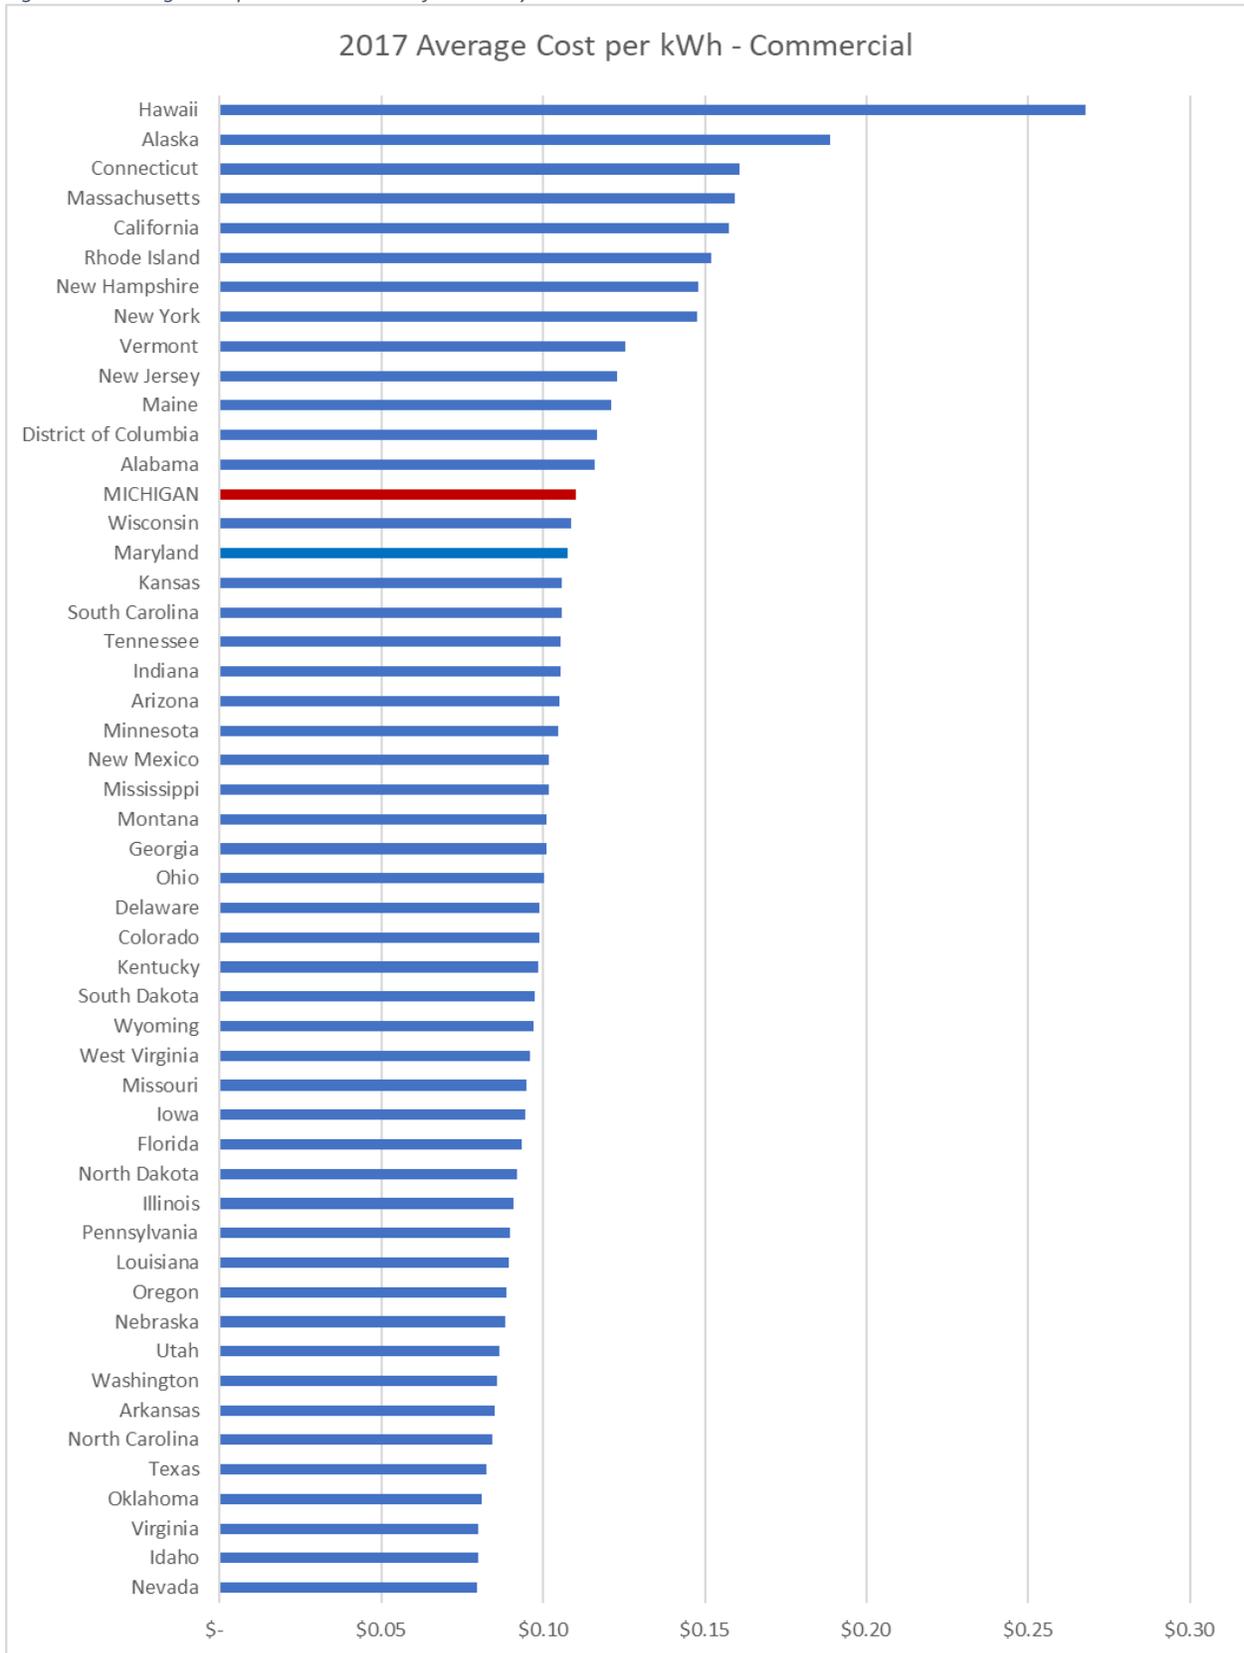

Figure 17: Annual average cost per kilowatt-hour of electricity delivered to commercial customers in each State 2007-2017.

Industrial Sector Electricity Rates

As shown in Figure 18, Michigan's 7.19 cents per kilowatt-hour price of electricity for the industrial sector is just above the median relative to other states, with Michigan ranking 24th highest. Figure 19 shows that Michigan's electricity price for industrial customers has been relatively stable, increasing every year until 2013 and then declining until 2017. The average compound annual growth rate of Michigan's industrial electricity cost from 2007-2017 was 1.06%, which was slightly above the median of the states.

Figure 18: Average cost per kilowatt-hour of electricity delivered to industrial customers in each State in 2017.

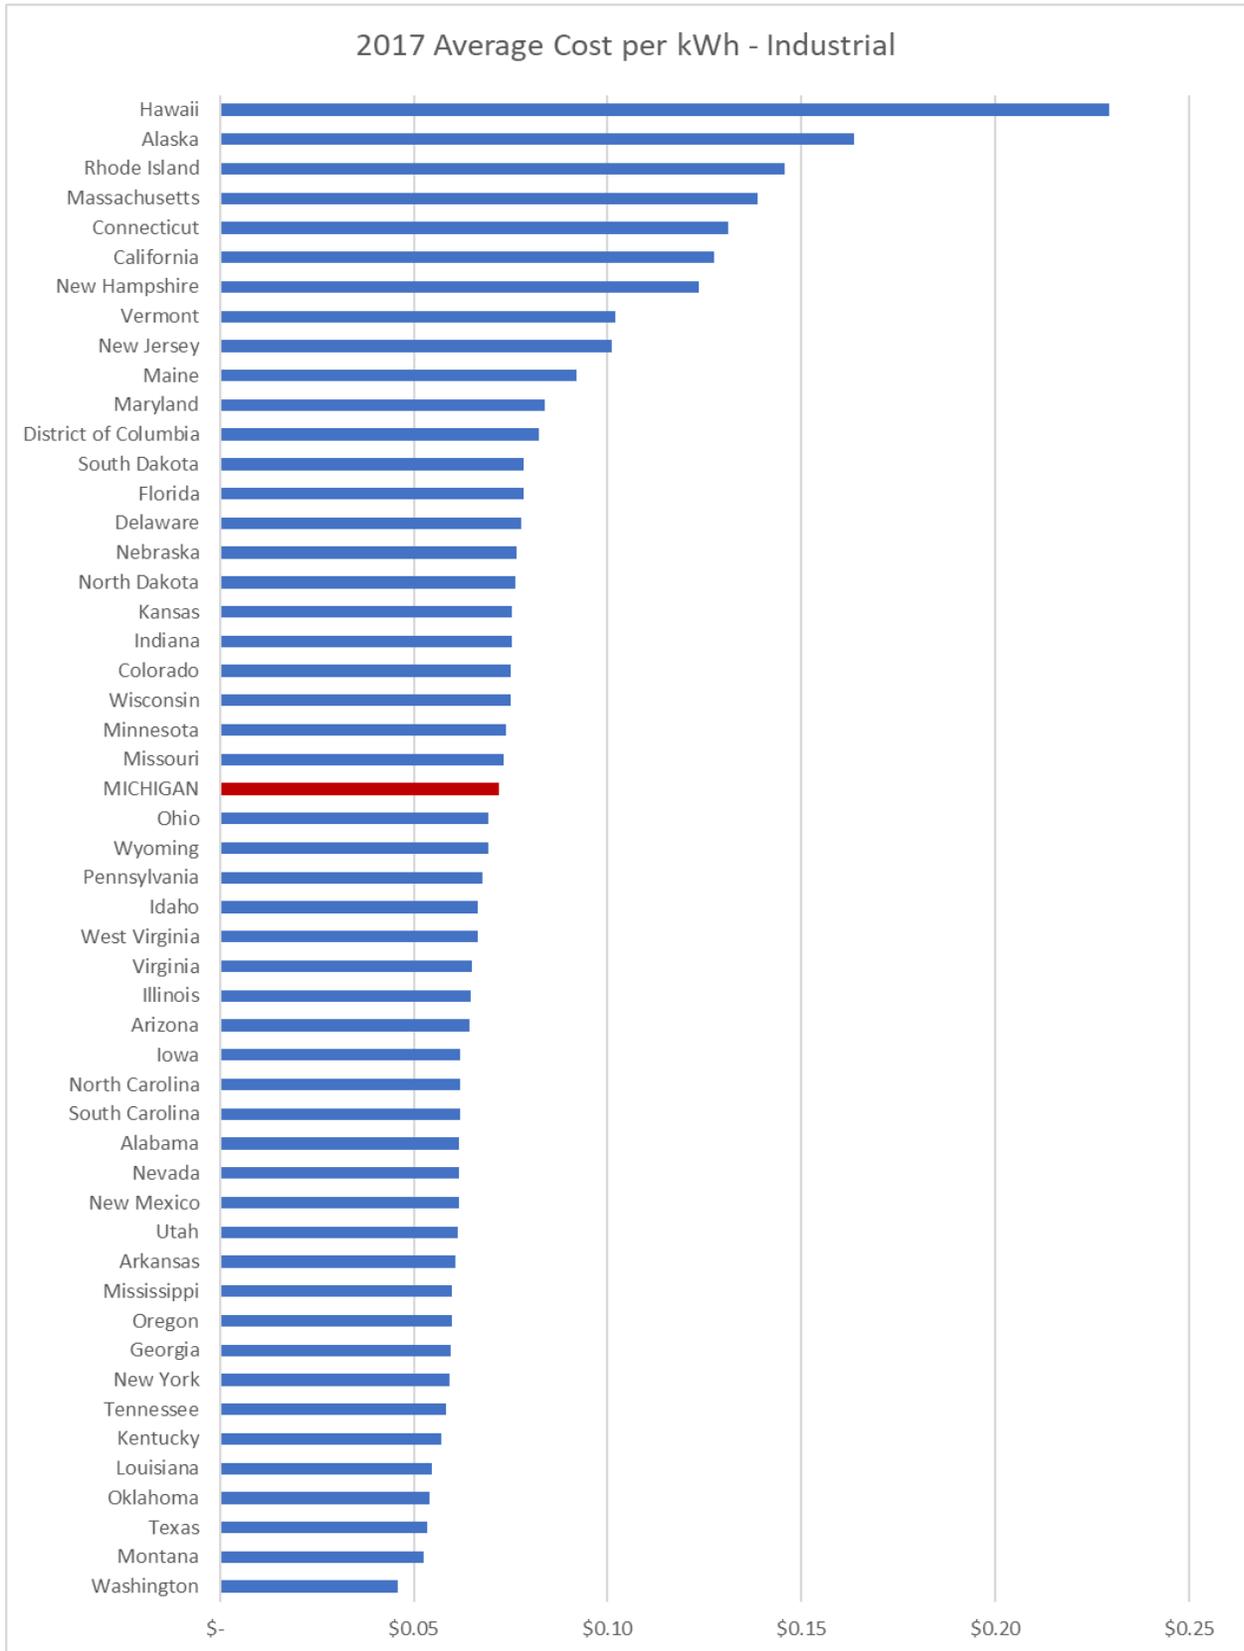

Figure 19: Annual average cost per kilowatt-hour of electricity delivered to industrial customers in each State 2007-2017.

All Sectors Electricity Rates

Michigan's average price of electricity across all sectors ranked 14th highest amongst all states in 2017, with an average price of 11.28 cents per kilowatt- hour, as shown in Figure 20. Figure 21 shows that Michigan's average price of electricity for all sectors combined increased substantially from 2007-2013 and has since been relatively stable but peaked in 2017. The average compound annual growth rate of Michigan's combined electricity cost from 2007-2017 was 2.83%, which was exceeded by only 15 states. Of the states with higher average electricity prices than Michigan, only Alaska also experienced higher increases in rates than Michigan.

Figure 20: Average cost per kilowatt-hour of electricity delivered to all customers in each State in 2017.

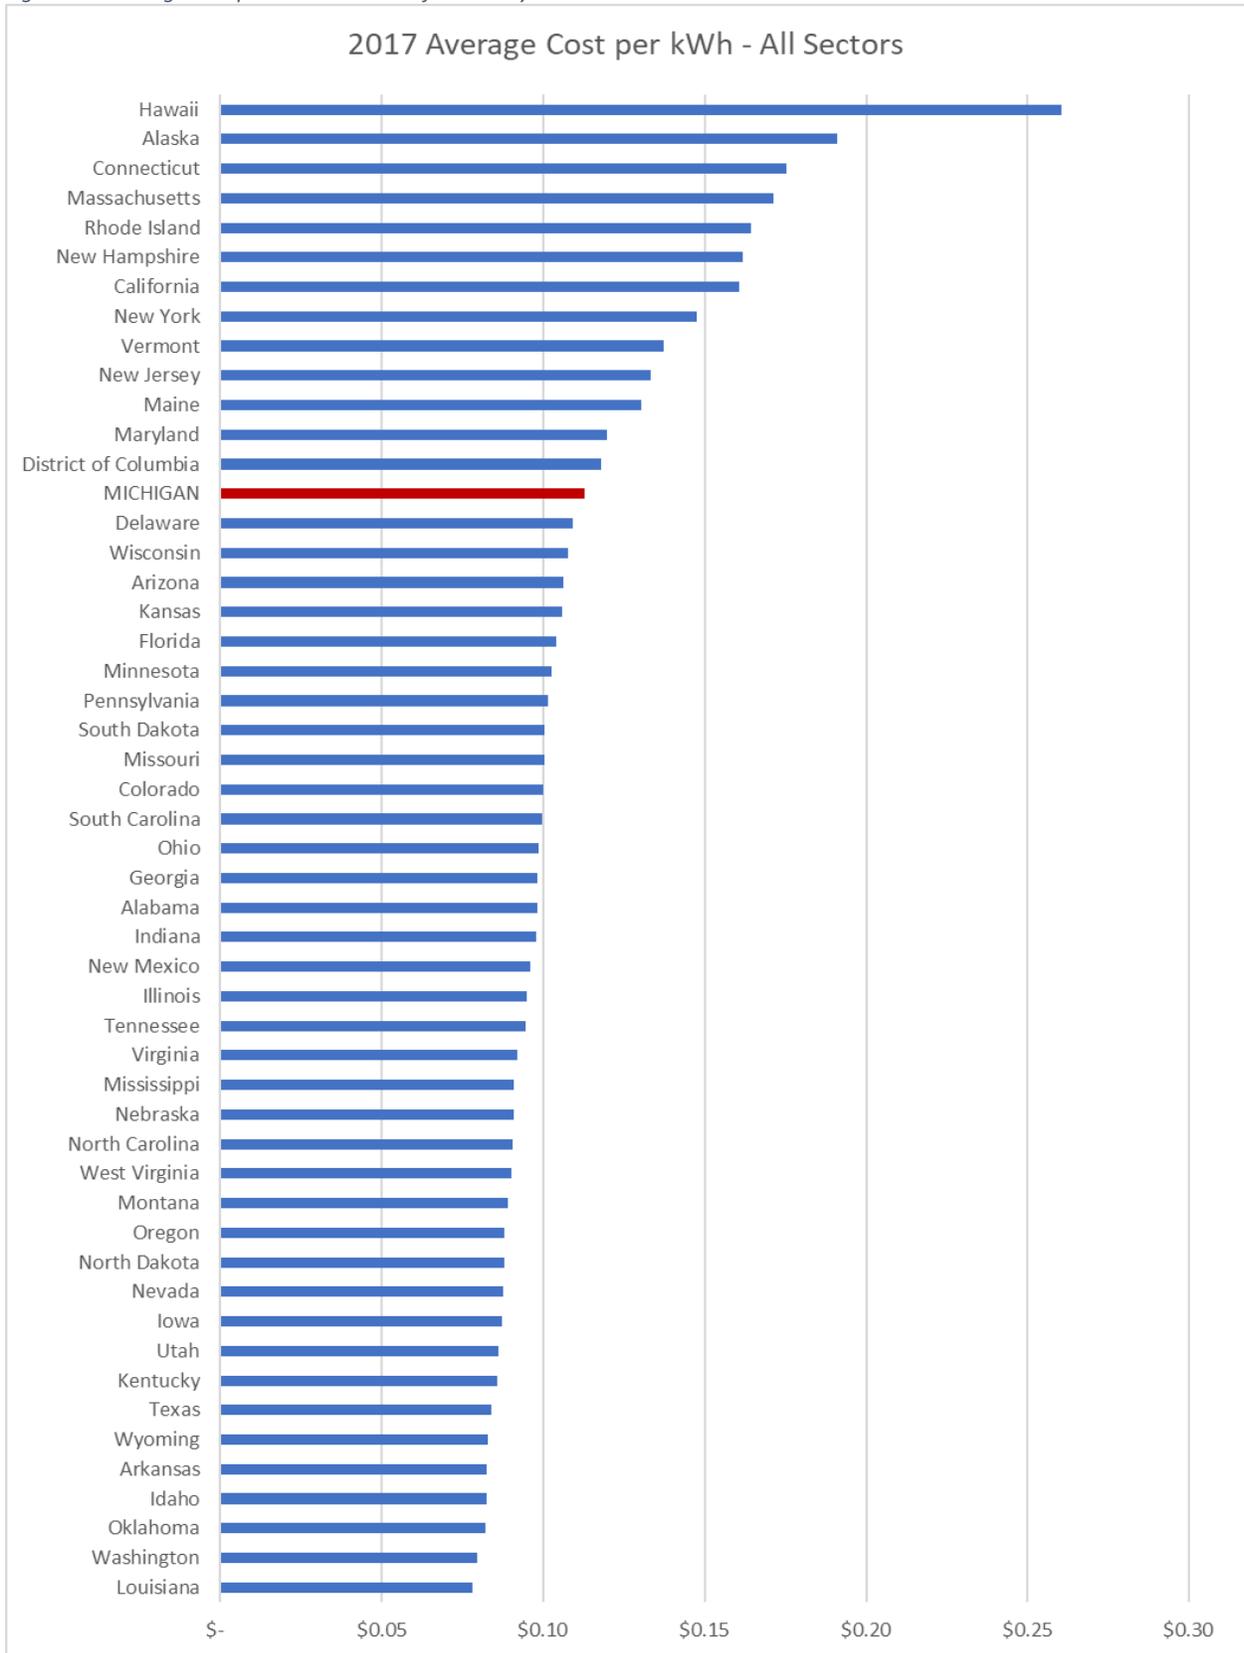

Figure 21: Annual average cost per kilowatt-hour of electricity delivered to all customers in each State 2007-2017.

Environmental Impacts

There are many dimensions to environmental impact, but this report will focus on two broad categories important for determining the degree to which the production of energy is friendly to the environment and human health: first, power plant emissions of air pollutants, and second, the amount of electricity generated by non-emitting renewable sources.

Pollution

Power generation can affect many aspects of the environment in multiple ways, but the most ubiquitous form is the emission of pollutants into the atmosphere. Power plants produce many different pollutants, but the largest quantities and arguably greatest effects are from:

- carbon dioxide (CO₂), which is the principal gas causing climate change and can reduce cognitive function;
- sulfur dioxide (SO₂), which causes asthma attacks, cardiopulmonary diseases, acid rain and is a chemical precursor to formation of small particles that when breathed cause a number of respiratory and other problems, miscarriages and birth defects;
- and nitrogen oxides (NO_x), which cause respiratory problems including wheezing, asthma and other breathing difficulties and is a chemical precursor to formation of small particles and ozone in the air that also cause numerous health problems.

Electric utilities report emissions of key pollutants from each power plant to the Environmental Protection Agency, which compiles this information and makes it available to the Energy Information Administration. Calendar year 2017 is the most recent complete compilation currently available and can be obtained from <https://www.eia.gov/electricity/data/emissions/>. Although effects on the environment and human health are determined by the quantity of pollution released and, in the cases of sulfur dioxide and nitrogen oxides, by location relative to human population and natural resources. However, as a measure of overall utility performance, it is most appropriate to consider emissions per unit of power generated. The following table summarizes Michigan's contributions to total pollution and pollution per GWh generated. Pollution quantities are in metric tons (approximately 2200 pounds per metric ton), pollution rates are in metric tons per gigawatt-hour (million kilowatt-hours) of electricity generated, and Michigan's relative rank amongst the states is shown parenthetically after each of the pollution metrics.

2017 Metric	Total Pollution	Pollution per GWh
Carbon Dioxide (Metric Tons)	58,413,899 (10 th highest)	520.1 (20 th highest)
Sulfur Dioxide (Metric Tons)	75,914 (6 th highest)	0.68 (10 th highest)
Nitrogen Oxides (Metric Tons)	50,353 (7 th highest)	0.45 (21 st highest)

Carbon Dioxide Emissions

As shown in Figure 22, Michigan ranked 20th worst amongst the states in carbon dioxide pollution per gigawatt-hour in 2017 with 520.1 metric tons emitted for every gigawatt-hour generated. This is only modestly above the median of the states.

Figure 23 shows that Michigan's carbon dioxide emissions per gigawatt-hour have significantly and steadily declined since 2007, similar to relative declines in most states so that Michigan's relative ranking has not changed. Figure 24 shows that, because Michigan is a larger state, its annual carbon dioxide emissions of 58,413,899 metric tons ranked 10th worst amongst states in 2017.

Figure 22: Carbon dioxide emissions in metric tons per gigawatt-hour electricity generation in each State in 2017.

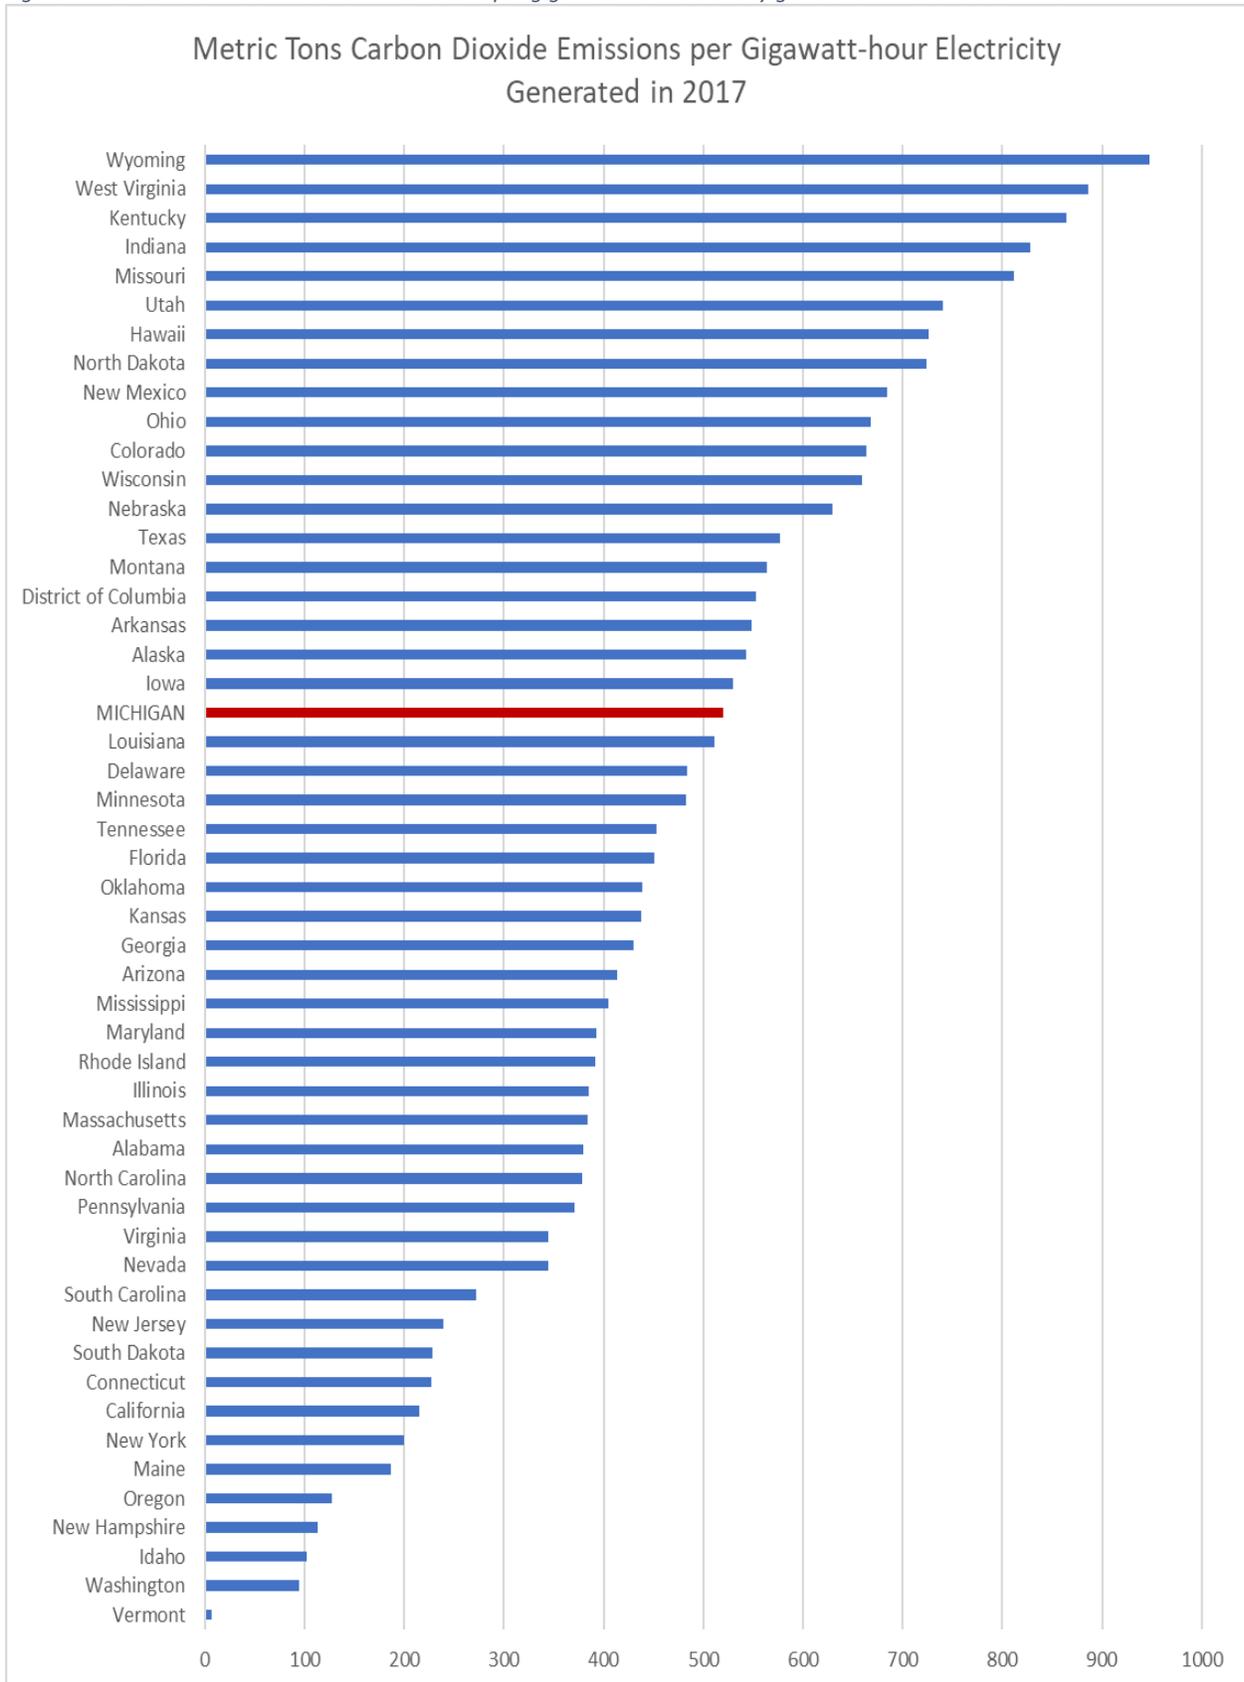

Figure 24: Annual carbon dioxide emissions in metric tons from electricity generation in each State 2007-2017.

Sulfur Dioxide Emissions

As shown in Figure 25, Michigan ranked 10th worst amongst the states in sulfur dioxide pollution per gigawatt-hour in 2017 with 0.68 metric tons emitted for every gigawatt-hour generated. This emissions rate is significantly higher than in most states.

Figure 26 shows that Michigan's sulfur dioxide emissions per gigawatt-hour have significantly and steadily declined since 2007, similar to relative declines in many states. However, enough states have improved faster than Michigan so that Michigan's relative ranking has not improved. Figure 27 shows that, because Michigan is a larger state, its annual sulfur dioxide emissions of 75,914 metric tons ranked 6th worst amongst states in 2017.

Figure 25: Sulfur dioxide emissions in metric tons per gigawatt-hour electricity generated in each State in 2017.

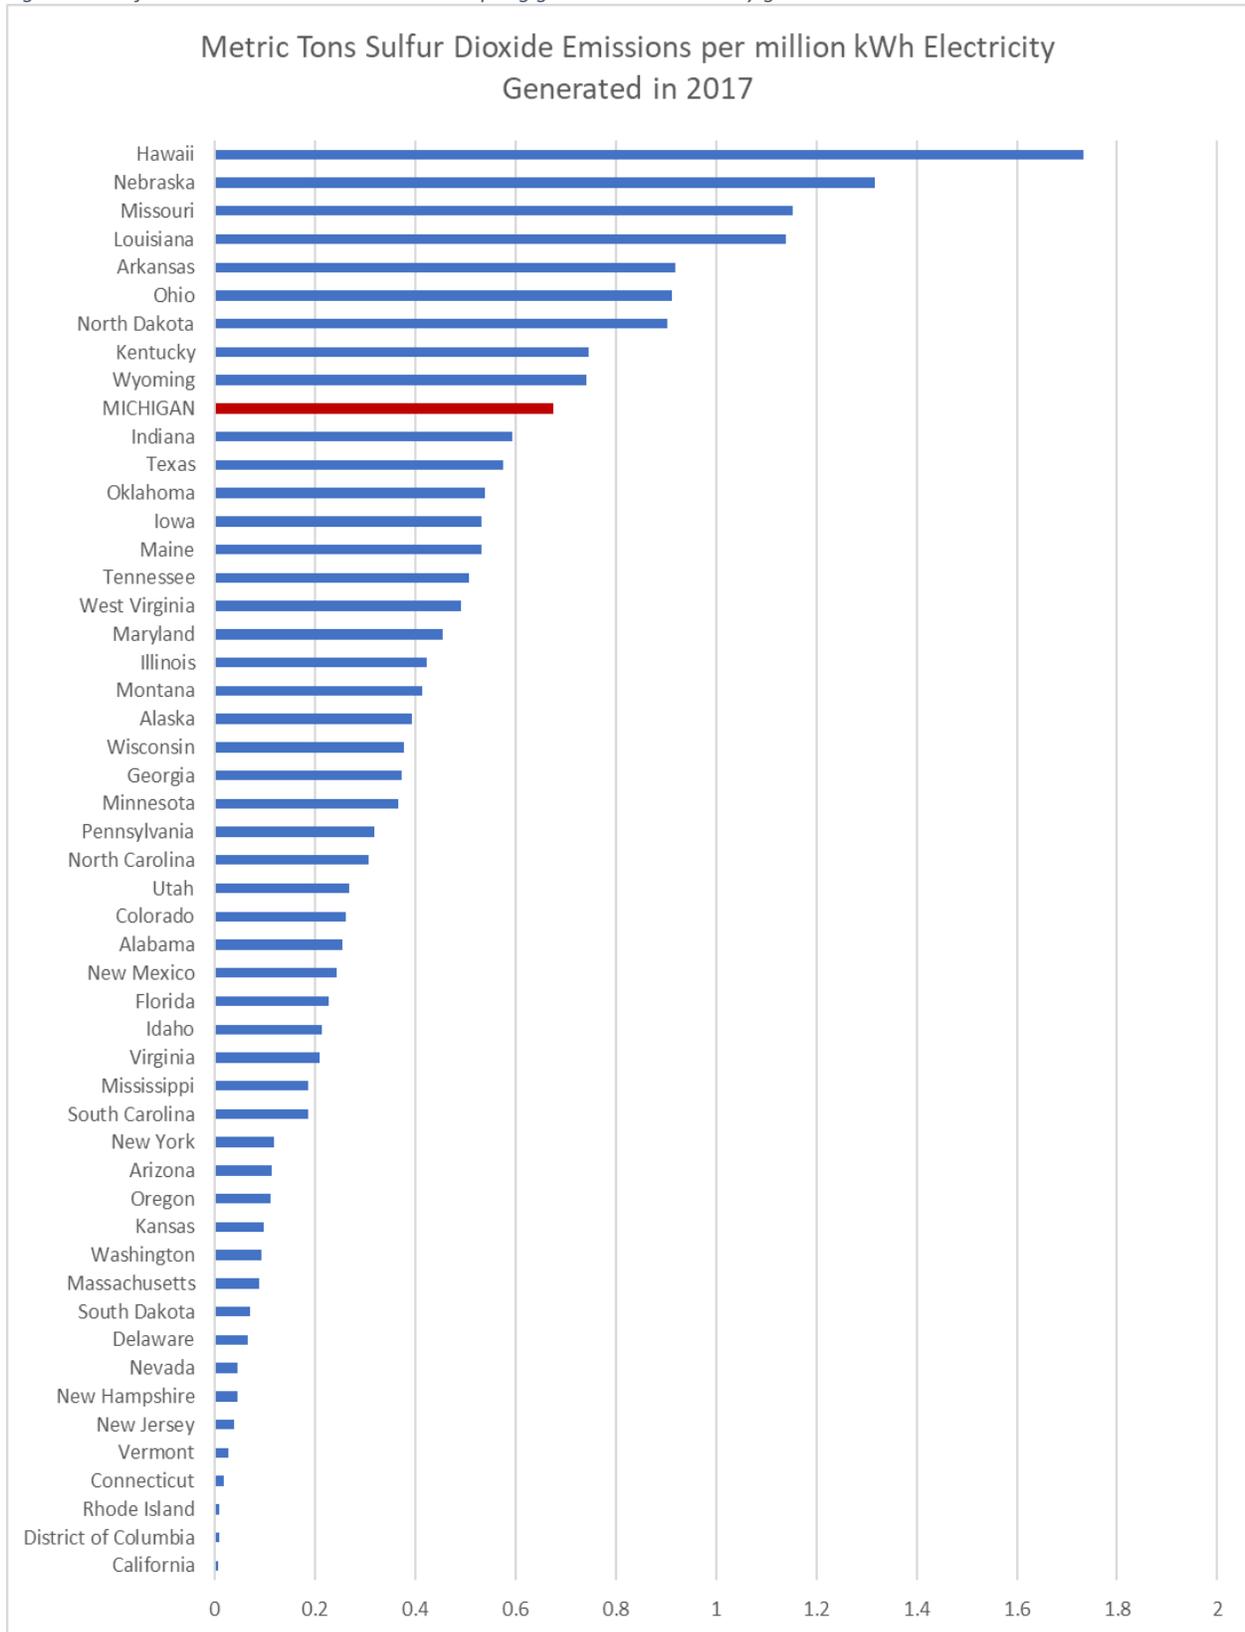

Figure 26: Annual sulfur dioxide emissions in metric tons per gigawatt-hour electricity generated in each State 2007-2017

Nitrogen Oxides Emissions

As shown in Figure 28, Michigan ranked 21st worst amongst the states in nitrogen oxides pollution per gigawatt-hour in 2017 with 0.45 metric tons emitted for every gigawatt-hour generated. This is only modestly above the median of the states.

Figure 29 shows that Michigan's nitrogen oxides emissions per gigawatt-hour have significantly and steadily declined since 2007, similar to relative declines in most states so that Michigan's relative ranking has not changed. Figure 30 shows that, because Michigan is a larger state, its annual nitrogen oxides emissions of 50,353 metric tons ranked 7th worst amongst states in 2017.

Figure 28: Average nitrogen oxides emissions in metric tons per gigawatt-hour electricity generated in each State in 2017.

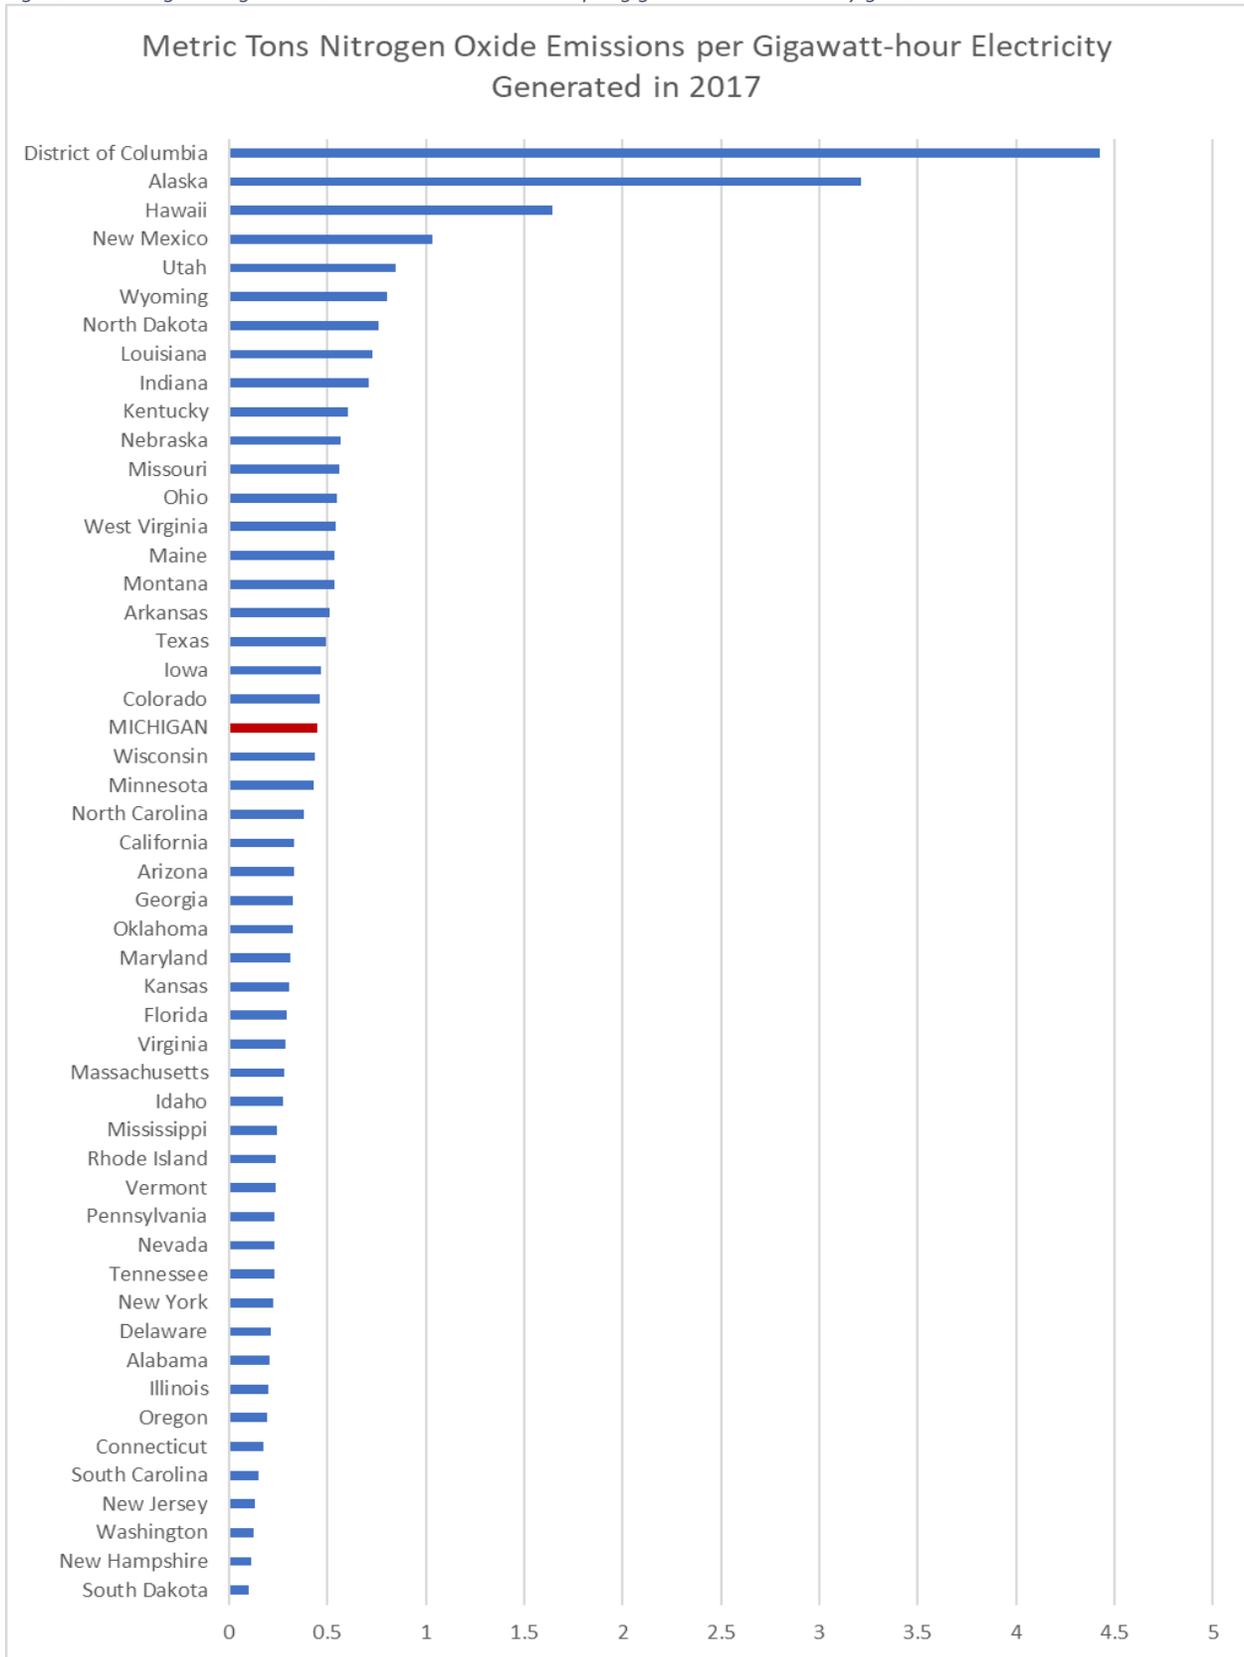

Figure 29: Annual emissions of nitrogen oxides in metric tons per gigawatt-hour in each State 2007-2017.

Renewable Generation

Michigan ranked 19th worst in renewable generation relative to total electricity generation in 2017. Renewables accounted for 8.4% of total electricity generation in Michigan in 2017. Michigan's rank falls to 27th when conventional hydroelectric is removed from renewable generation.

For renewable generation relative to electricity sales, Michigan ranks 21st worst. When hydroelectric is removed, Michigan ranks 28th worst.

In terms of magnitude of total renewable generation, Michigan ranks 20th best with hydroelectric and 13th best without hydroelectric.

Figure 31: Annual renewable generation, including hydropower, in each State in 2017 as a percent of total electricity generation in that State.

Michigan Electric Utility Performance

The following section displays reliability and affordability metrics for individual Michigan utilities.

Reliability

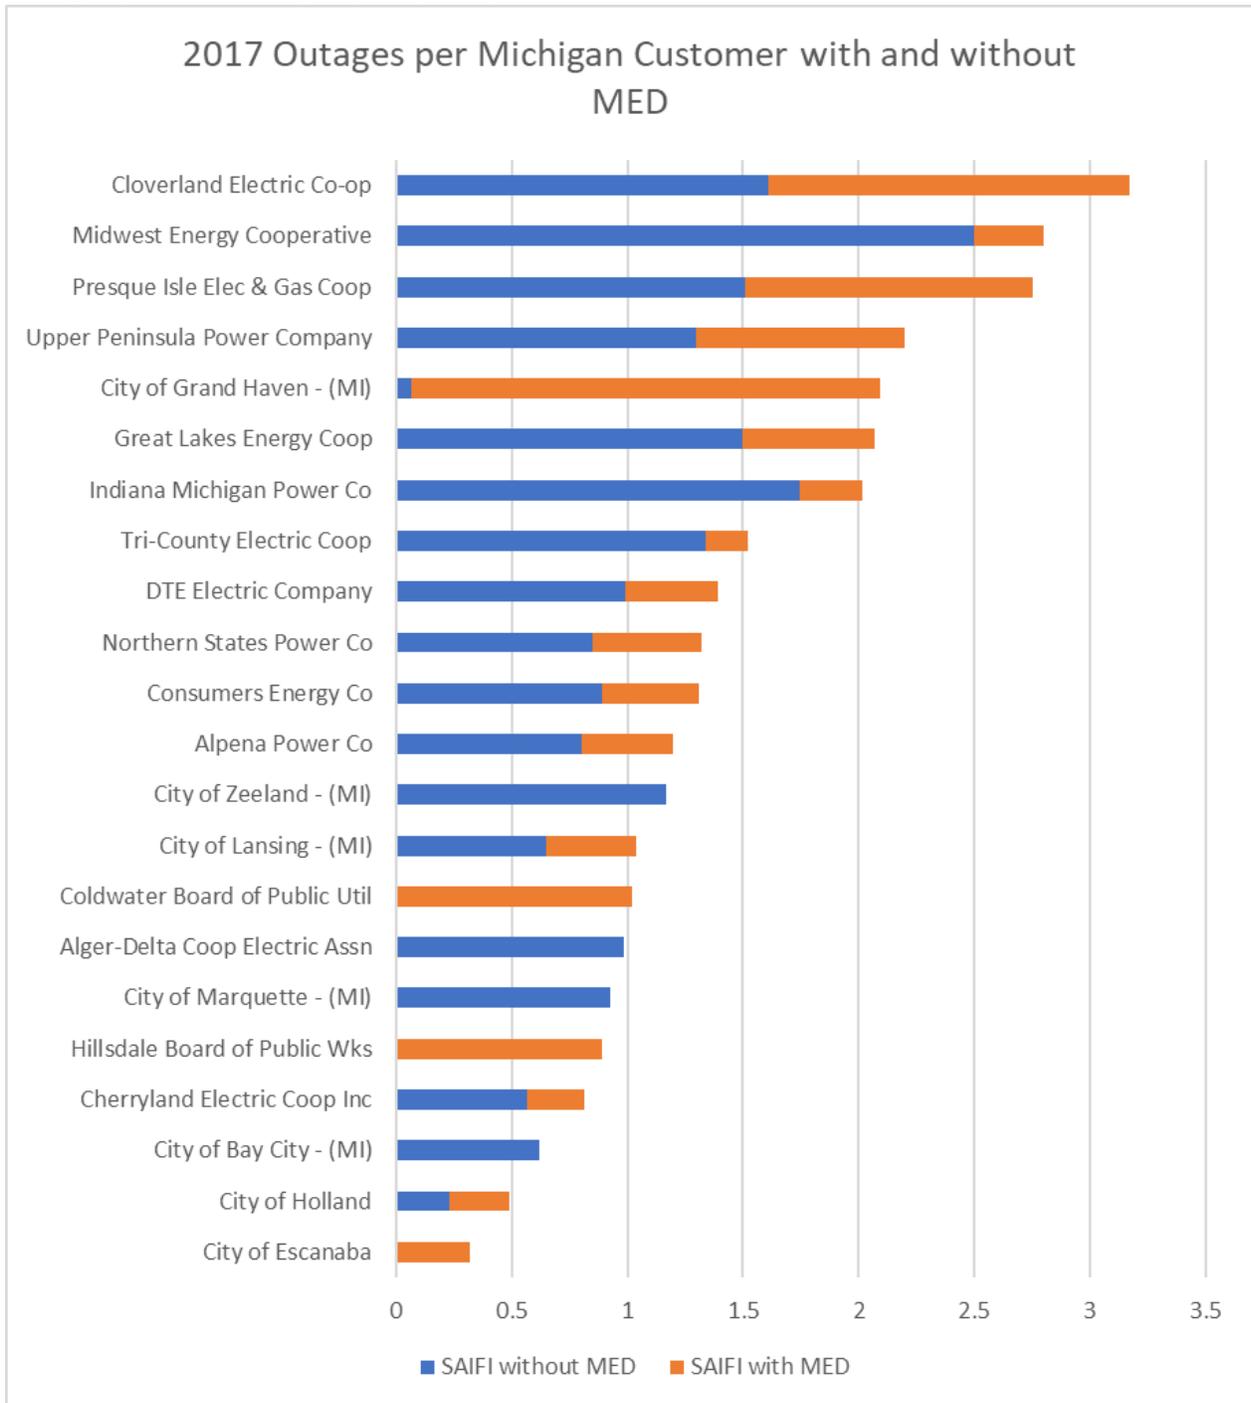

Average Minutes of Outage per Customer per Year (SAIDI)

SAIDI with MED						
Utility	2013	2014	2015	2016	2017	Trend
DTE Electric Company	583	793	277	238	1063
